**Ensemble Business Software Releases
e-Commerce Solution for Apparel and Footwear Vendors**

Beavercreek, Oregon – April 17, 2005 – Ensemble Business Software, a provider of ERP solutions for the apparel and footwear market, today announced an e-Commerce application featuring a fully integrated, affordable, out-of-the-box solution that quickly and effectively brings organizations into the online arena. The new e-Business Manager module has been designed to expand functionality as needed by plugging in "applets" that address specific requirements.

The .store applet, which provides business-to-consumer e-commerce capabilities, includes a number of powerful features that enable companies to efficiently and effortlessly sell products and services online while enhancing service to customers. This applet allows companies to leverage the power of the Internet to acquire new customers who can browse products and securely place online orders. Fully integrated with Ensemble Business Software, .store links with the Credit Card Processing module and is designed for use with other e-Business Manager Solution applets including .order and .inquiry.

The .order applet provides a business-to-business solution allowing existing customers a password-protected method for placing orders directly into the Ensemble Business Software system whenever they desire by going through a Web site. Benefits include increased accuracy of orders and reduced operating expenses by allowing customers to place orders without the need for administrative and sales support.

The .inquiry applet grants customers instant online access to their account and/or order status. Drill-down capabilities allow customers to update essential account information, like adding a new shipping address.

About Ensemble Business Software
